

**INEVA Cleanses the Future**

*“Ineva, the new investment of Coşkunöz Holding, left its mark on 4th OIZ Environment Summit with its technology offering permanent solutions in waste disposal for a clean future”*

Ineva A.Ş. operating on the area of environment technologies was debuted for the first time in 4th OIZ Environment Summit that is the new company of Coşkunöz Holding making investments on environment sensitivity and renewable energy since 2013.

390 persons from 110 OIZ were participated in 4th OIZ Environment Summit held by Ministry of Science, Industry and Technology, Ministry of Environment and Urbanisation and Organized Industrial Zones Senior Organization (OIZSO) in Bursa Crowne Plaza on 26-28 May 2016. **Cahit Nakiboğlu OIZSO Chairman of the Executive Board and Ibrahim Burkay President of Bursa Chamber of Commerce and Industry** were also taking part among the visitors visiting Ineva Environment Technologies Stand that is platinum sponsor of the summit gathering representatives of all organized industries in Turkey. The technology has attracted great interest that provides great advantage in terms of investment costs by means of the system applied without requiring drying process developed by Ineva as a result of R&D studies supported by TUBITAK (Scientific and Technological Research Council of Turkey).

At the second day in summit, the Ineva attending as panelist to last meeting on Treatment Sludge and Waste Water Technologies shared its technology generating electrical energy during waste disposal with participants. Ineva being as a fully domestic company that performed disposal process with incineration system for the first time having so much installation and operating costs due to supplying from abroad and made only by the state monopoly organization for years explained system installation by producing “**tailor method**” according to type of waste and need.

The plant of Ineva company in DOSAB was visited more than 100 persons on 28 May 2016 within summit program. The visitors having the opportunity to know better the system also had the opportunity to understand environment technology generating energy during disposing wastes with an ecological system.

**Ineva, generates energy from wastes**

Ineva protects the environment by producing ash at the rate of 4% of wet sludge with the emission far below the limits by waste incineration system used by Ineva. In addition, it produces electrical energy from steam produced during this operation. 1.5-ton steam energy is generated for each 1-ton waste disposal and it can also be converted into electrical energy.

**First domestic waste disposal plant with incineration technology without drying**

Foundations of Ineva was established in 2004 to eliminate foreign dependence and to make contribution for the economy of the country by naturalizing waste disposal plants. This system that was developed with TUBITAK being as an environment project had highest grant ratio in the relevant year, become first waste incineration project put into service with 100% domestic capital. Ineva that conducted 6 plants installation in last 3 years increased its synergy by joining Coşkunöz Holding in

May 2016. Ineva aims to increase the number of plants that produce “**clear energy**” domestically and internationally while finding an innovative solution for a significant environmental issue in this context.
